INTELLIGENT EVENT MANAGEMENT, PERSONALIZATION & NETWORKING PLATFORM

eventra

Plan Smarter. Participate Better. Connect Meaningfully.

One integrated platform that helps organizers run events, helps students plan their participation, and helps participants find the right teammates and mentors.

Team The Third Commit Akshita Mohanty · Akriti Singh · Anshiv

THE PROBLEM

Great events need coordination. Today they depend on scattered tools — for both organizers and attendees.

ORGANIZERS STRUGGLE WITH…

- Not knowing how many registrants will actually attend
- Popular events hitting capacity while others have spare seats
- Manual registrations and cancellations in spreadsheets
- Inefficient resource allocation and no way to evaluate performance

STUDENTS STRUGGLE WITH…

- Finding events relevant to their interests
- Overlapping sessions and forgotten timings
- Missing opportunities they never hear about
- Finding teammates, mentors and collaborators

A TYPICAL CAMPUS FEST

A three-day technical fest: 1,000 students, 20 events, 50 volunteers, multiple venues. Announcements go out on Instagram and WhatsApp, registration happens through Google Forms, and the attendee list is a spreadsheet cleaned up the night before. Nobody knows how many seats are left, some students register twice, others are missed — and no one learns from the results.

The Challenge | One intelligent platform that connects both sides of the event.

FLOW OF THE PROBLEM

Without a central system, every event repeats the same disconnected journey.

Event Announced

Posters, groups and social pages

1

Links Scattered

Forms and updates on different platforms

2

Manual Sign-ups

Responses copied into sheets by hand

3

Unclear Seats

No live view of capacity or waitlist

4

Errors & Duplicates

Lists drift out of sync

5

No Insight

Nobody compares sign-ups with actual attendance

6

The result | Event management that relies on coordination instead of a reliable, data-driven system.

THE EVENTRA SOLUTION

One platform, three connected pillars — not three separate products.

PILLAR 1

Smart Event Operations

- For organizers & admins
- Create, edit, publish, cancel events
- Smart registration with capacity limits
- QR check-in & waitlist management
- Attendance analytics & resource planning
- Event performance & feedback stats

EXAMPLE: AI WORKSHOP

100	95
Capacity	Registrations
78	**82.1%**
Actual check-ins	Attendance rate

17 registered attendees did not check in. That insight informs capacity, reminders and waitlist decisions for future events. First version uses plain Java business logic, no ML.

PILLAR 2

Personalized Experience

- For students & attendees
- Interest profiles
- Smart event recommendations
- Personal schedule & conflict detection
- Event reminders
- Personalized dashboard

EXAMPLE: SCHEDULE CONFLICT

AI Fundamentals	10:00 – 11:00 AM
Java Masterclass	10:30 – 11:30 AM

Schedule conflict detected: these two workshops overlap by 30 minutes.

The student can then choose an alternative session.

PILLAR 3

Smart Networking

- For students, mentors & collaborators
- Skill profiles
- Teammate & mentor discovery
- Connection requests
- Collaboration interests
- Privacy-first: users can decline or disable requests

EXAMPLE: HACKATHON TEAM

Skills: Java, backend. Looking for a frontend developer, a UI/UX person and an AI-interested teammate.

WEIGHTED MATCH SCORE (illustrative)

Shared interests	40%
Complementary skills	40%
Compatible collaboration goals	20%

Weights can be tuned after testing.

THE CONNECTED WORKFLOW

The pillars exchange data — each step feeds the next.

01
Event Creation

Organizer publishes workshops, hackathons, talks

02
Registration

Students select interests and register

03
Personalization

Recommendations by interest match

04
Networking

Find hackathon teammates

05
Attendance

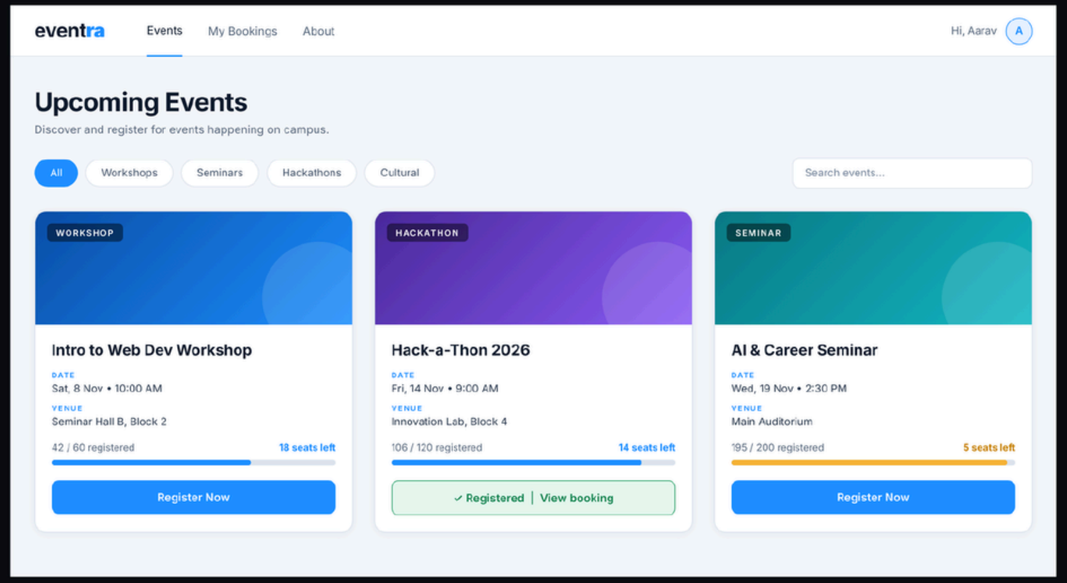

QR check-ins, waitlists, cancellations

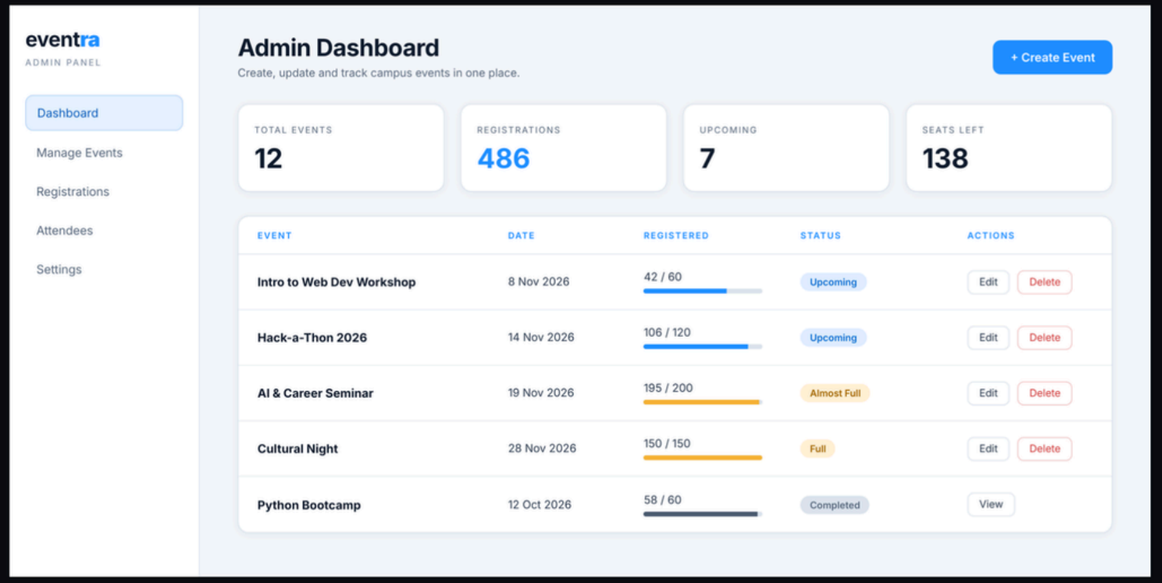

06
Analytics

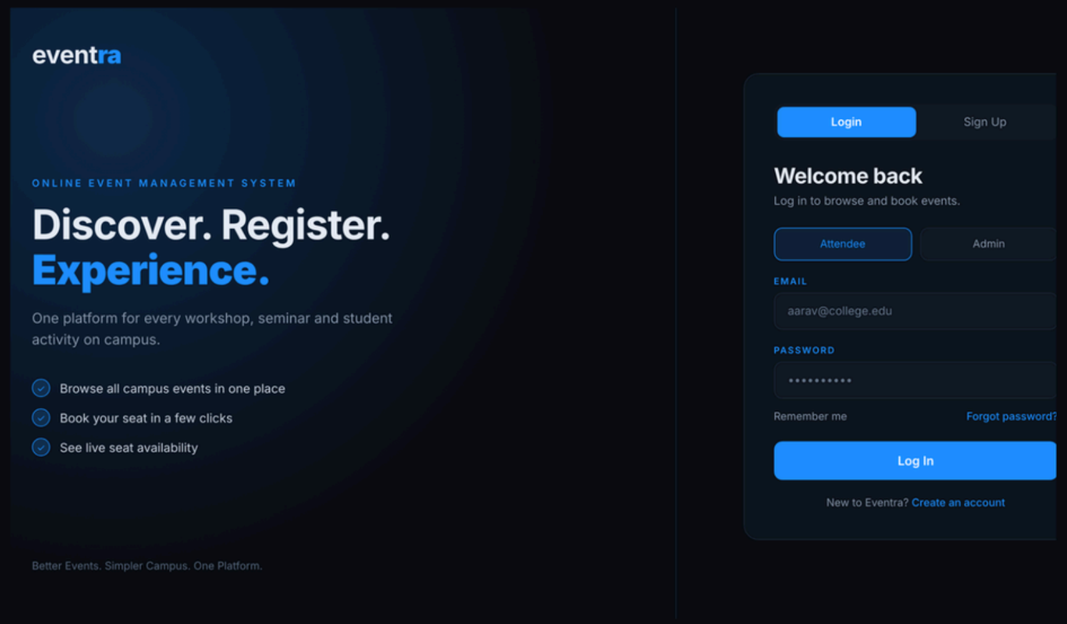

Registrations vs. attendance & feedback

Event Creation → Registration → Personalization → Networking → Attendance → Analytics → Better Future Events

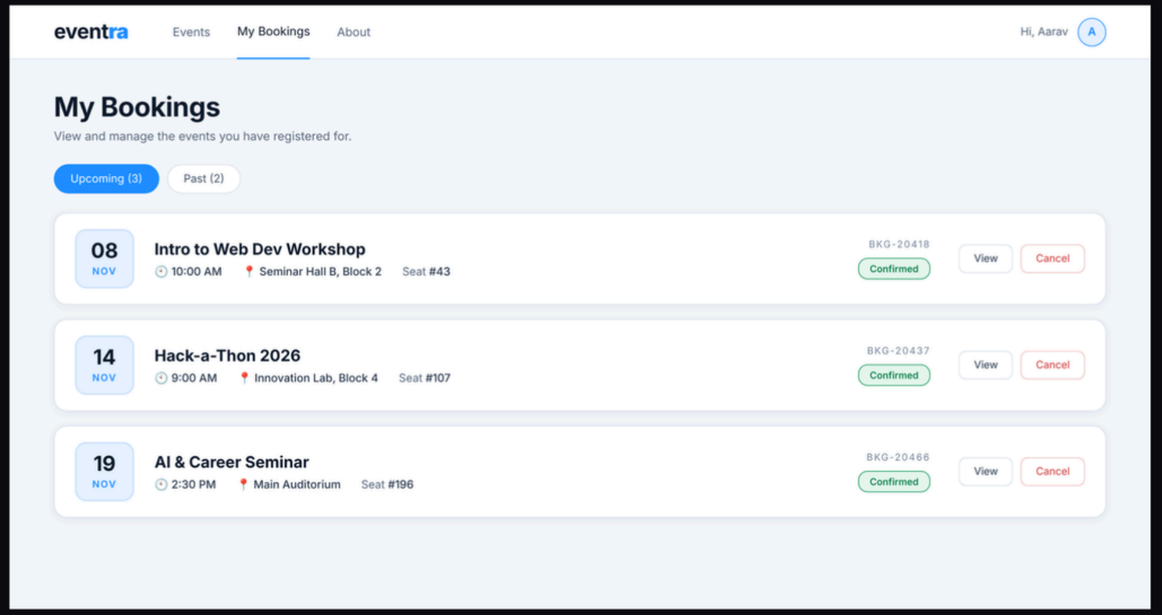

Why it matters | Insights from one event improve the planning of the next.

EXPLAINABLE INTELLIGENCE

Transparent Java business logic first — no black-box ML required for version 1.

A

Event Recommendation

- Score = matching interests ÷ relevant interests × 100
- 4 of 5 tags match → "80% interest match"
- An interest-match score, not a prediction of enjoyment

B

Attendee Matching

- Weighted score, tunable after testing:
- Shared interests 40%
- Complementary skills 40%
- Compatible collaboration goals 20%

C

Attendance Analytics

- Rate = check-ins ÷ confirmed registrations × 100
- AI Workshop: 95 registered, 78 checked in → 82.1%
- Also: cancellations, capacity use, waitlist conversion

Example | Two workshops overlap by 30 min → "⚠ Schedule conflict detected" and an alternative is suggested.

TECH STACK

Layered architecture: business rules in the service layer, persistence in the data layer.

Frontend

- HTML5, CSS3
- JavaScript
- Bootstrap

Backend

- Java
- Java Servlets
- Service layer, OOP

Database

- MySQL
- 13 core tables

Connectivity

- JDBC
- DAO pattern

Server

- Apache Tomcat

Dev & Testing

- Java IDE, Maven
- Git & GitHub
- JUnit, Mockito

Architecture

Attendee / Admin Portal → Web Controller (Servlets) → Service Layer (Event · Recommendation · Networking) → DAO → JDBC → MySQL

SCOPE & ROADMAP

Built in three phases so every phase ends in a working product.

Phase 1 · Foundation

- Login, attendee & admin roles
- Event creation & management
- Discovery, registration, cancellation
- Capacity checks
- Attendee & organizer dashboards

Phase 2 · Primary USP

- QR check-in
- Attendance analytics
- Interest-based recommendations
- Personalized schedules
- Conflict detection

Phase 3 · Networking

- Skill profiles
- Teammate recommendations
- Connection requests
- Waitlist automation
- Resource planning & post-event reports

OUR USP | Eventra is an intelligent event management platform that combines operational analytics, personalized event planning and interest-based networking in one integrated system.

Target audience | Campus events first (fests, workshops, seminars), extensible to hackathons and conferences.

FEASIBILITY & COMPETITORS

Feasible to build. Practical to use.

Feasibility

- Technical: established Java web stack and MySQL; layered design supports testing
- Economic: free tools, local deployment, no paid third-party services
- Operational: simple interfaces for attendees and admins
- DB integrity rules: no duplicate registration, capacity enforced, concurrency-safe booking

Platform	What they do	Our positioning
Eventbrite	Discovery, ticketing, registration	Campus focus + personal planning
Cvent	Comprehensive enterprise events	Lightweight, student-centric, networking built in
Sheets & Forms	Manual tracking	One connected, consistent system

Individual features exist in other platforms. Our USP is the integration, tuned for college events, hackathons and technical communities.

Our edge | Integrated operations + personalization + networking.

RESEARCH & REFERENCES

Applying established technologies to build a centralized, maintainable solution.

01

Eventbrite

Integrated discovery, registration, attendee management

eventbrite.com

02

Cvent

Professional event planning and management

cvent.com

03

Oracle JDBC

Java access to relational databases like MySQL

docs.oracle.com

04

Apache Tomcat

Servlet container and application server

tomcat.apache.org

05

OWASP

Parameterized queries prevent SQL injection

owasp.org

Why it matters | Servlets handle requests → JDBC connects → MySQL stores → safe parameterized queries.
